

# Functional Change

## Generic Press TP Added Automatically

### At A Glance:

With Prepress 7, when you add an output device, the Generic Press task is automatically added to your flow.

### Applies To:

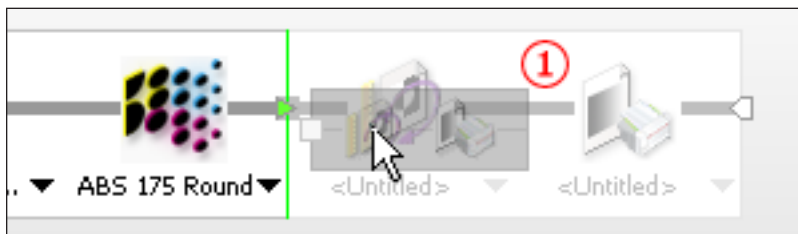

Prepress Automate, Manage, Control, PDF, PDF & Proof, PlateMaker

### How It Works:

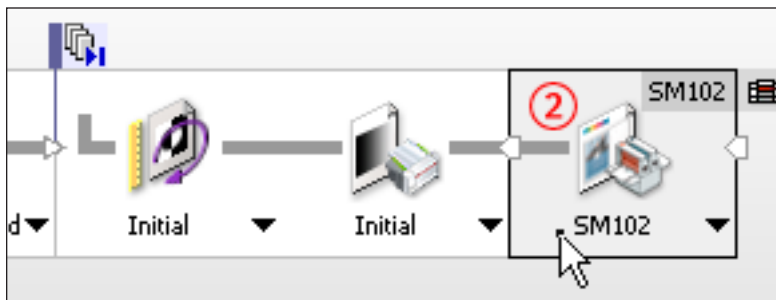

Simple! When you build a flow, you no longer have to add the Generic Press task yourself. Since all output flows (plate, film, proofing) must end with a Generic Press task, the system automatically adds one when ever you drag in an output task.

To see it in action, do the following.

1. Build a normal flow and add an output device.

2. Notice there's a Generic Press task placed at the end of the flow.

### Why is this Important?

This simply saves you a step when you build your plans. Because Prepress 7 now supports just one press task, the Generic Press TP, it makes it easy for the system to figure out how to end each flow.

An output device may be a generic TIFF device, a platemaker/filmsetter, or a proofer.
